                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                ò
was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gol electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GSS 06-MAR-2004
                                                                                                                                                                                                                                                                                                                        Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Email: nelsayed@tigr.org

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /clone="SALK 118621.41.35.x"
/clone lib="Ārabidopsis thaliana TDNA insertion lines"
/note="PCR was performed on Arabidopsis thaliana lines each of which contains one or more TDNA insertion elements. The resultant fragment for each line was directly sequenced to determine the genomic sequence at the site of insertion. Details of the protocols used car be found at http://signal.salk.edu/tdna_protocols.html"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is single pass sequence recovered from the left border of TDNA. This sequence lies within an annotated intron of At4g22800. Class: TDNA tagged.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        44.3%; Score 12.4; DB 8; Length 27; 72.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114[gb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XII.0-Gold (Stratagene) cells and selected for ampicillin resistance."

Laboracy yourse DNA kesource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch oritice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwM92 (giffa)2114 [gb](AF129072.1), a copy-number inducible derivative of plasmid RI. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Koslin, Midlothian, E125 9PS, UNITED KINGDOM
Single pass sequencing. Bases called and trimmed with phred
V0.020425.c. Vector identified by cross match with the -minscore 20
and -minmatch 12 options. Vector:pBlueScriptII(KS+) R. Site 1:
ECORI R. Site 2: NotI Description: Normalised library constructed
from pooled tissue from day 30 placentas. Clones available from UK
Centre for Functional Genomics in Farm Animals, Roslin Institite,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWD42 (gilfy132114 [gb]AR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll X110-GG1d (Stratagene) cells and selected for ampicillin resistance."

Carroll SF, Better MD, Berhard SL,

WPI; 1993-167617/20.

Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo.

Example 3; Page 35; 163pp; English.

Fifteen analogues of gelonin were constructed. Ten non-cysteine residues in surface positions and available for conjugation to a second protein were targeted for substin. In the other analogues, one or both of the native Cys residues present in gelonin were substd. Overlap extension PCR was used to construct the various analogues. Primer geloC-20 was used in

RESULT 2

The inventors claim vectors which express a rabies virus antigenic protein in eucaryotic cells. AANS0399 is part of a vector designed for expression in yeast. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library.
In analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring can expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid to the sequence or specific contaction to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening CDNA or genomic libraries or subclones
                                                                                                                                                                                                                                                                                                                                New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its

Suppraction (SPRE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the colliquoucleotides of the invention. The PCR primers are used to amplify a cliquoucleotides of the invention. The PCR primers are used to amplify a cliquoucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The presence or identity of a SNP and for genotyping nucleic acid sample by colliquoucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of caused by one or more SNPs. Phenotypic traits include disease e.g. adjunctionally a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include disease e.g. osteogenesis imperfecta and acute intermittent porphyria. Phenotypic craits also includes symptoms of or susceptibility to multifactorial disease, including, rheumatoid arthritis, multiple sclerosis, craits also including, rheumatoid arthritis, multiple sclerosis, including, rheumatoid arthritis, multiple sclerosis, conference, nervous system diseases and infection by pathogenic conference expressing internity analysis. The present sequence represents a single nucleotide primer extension (SNPR) primer specific for a human SNP containing DNA
                                                                                                                                                                                                                                                                                                                                                           New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the concleic acide further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid containing sequence. The array of nucleic acid containing sequence or specific or utations of any gene, in mapping the 5' termini of mRNA molecules by cylimer extensions or in screening obby or genomic libraries or subclones for additional subclones containing segments of DNA that have been consolic soldated and previously sequenced. The sequence presented is one of the complex acid probes incorporated in the microarray. Note: The sequence date for this patent can also be obtained in electronic format directly from user or used and procoperated in the microarray.
                                                            New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of diagnosing non-small cell lung cancer (NSCLC) or a predisposition to developing NSCLC in a subject by determining the expression level of a NSCLC-associated gene in a biological sample derived from the subject, where an increase or decrease of the level compared to a normal control level of the gene indicates that the subject suffers from or is at risk of developing NSCLC. The method is useful in diagnosing NSCLC or a predisposition to developing NSCLC in a subject. The compound, polymucleotide and the encoded NSCLC in a subject or an eseful in treating or preventing NSCLC. This sequence corresponds to a primer for semi-quantitative PCR amplification of genes that are differentially expressed in NSCLC cells.
                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing, preventing and treating non-small cell lung cancer (NSCLC) comprises determining an expression level of an NSCLC-associated gene in

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10569-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyham syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Pabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary comparance for spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, cante intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases New isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease. Arraying genome clones.

Claim 4; Page 9; 528pp; Japanese.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in ABL43188

Modification of the cell wall components of a plant - useful for improving digestion efficiency of crops and feed crops.

Example 1; Page 21; 24pp; Japanese.

This invention describes a novel nucleic acid used for modifying the cell wall components of a plant. The modification is used for the improvement in digestion efficiency of useful crops and feed crops. The DNA is useful in agriculture, industry and gardening. AASB3800-Z89385 represent PCR primers used in the amplification of the Arabidopsis thaliana ACWI protein which is described in the method of the invention

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms. Compainty members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific comparations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the companion of the form of the microarray. Note: The sequence of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;

```
The present invention describes a method for detecting an analyte in a sample. The method comprises: (a) providing detection probes being labelled with a first reporter, where the detection probes are capable of binding to the analyte; (b) providing objuding to the analyte; (c) providing capture probes being bound or capable of binding to the solid support, (d) providing concentrating the analyte on the solid support and the capture probes; and concentrating the detection probes where (i) the detection of detection probes; and (e) detecting the detection probes where (i) the detection of detection concentrating the detection probes; and (c) surplus detection probes; and the first reporter of said capture probes; and of capture probes binding to anyplus detection probes; and/or (ii) the solid support is labelled with a second reporter different from the first reporter; imaging the sample at an emission wavelength of the second reporter; imaging the sample at the emission wavelength of the second reporter; conting the detection probes; and the present sequence represents an emission probes; the present sequence represents an entity of the sample at the present sequence represents an analysis of the present sequence represents an analysis of the present sequence represents and applying this mask to an image of the sample used for coligonucleotide used in the detection of c-fos mRNA, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting an analyte such as protein or nucleic acid, useful for screening drugs, comprises probe detection of captured analyte where surplus probe signal is quenched and/or differential emission wavelength
                                                                                                                                                                                                       analyte detection; detection; probe; detection probe; reporter; human;

The present invention describes a method for detecting an analyte in a sample. The method comprises: (a) providing detection probes being labelled with a first reporter, where the detection probes being binding to the analyte; (b) providing a capture probes being bound or capable of binding to the solid support; (c) providing capture probes being bound or capable of binding to the analyte, and so concentrating the analyte on the solid support; (d) contacting the sample with the detection probes, the solid support and the capture probes; and (e) detecting the detection probes where (i) the detection of detection probes in conducted in the presence of quenching probes binding to surplus detection probes and/or (ii) the solid support is labelled with a second reporter different from the first reporter of said surplus detection probes; and/or (ii) the solid support is labelled with a second reporter different from the first reporter; imaging the sample at the emission wavelength of the second reporter, generating a mask obtained from imaging this mask to an image of the sample used for reporter and applying this mask to an image of the sample used for detecting the detection of the present sequence represents a capture of obtained between the present sequence represents a capture of the sample and the present sequence represents a capture of the second reporter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          example from the present invention.

The present invention relates to an antisense compound targeted to a mucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neomatal or infantile epilepsy, or ataxia. The present sequence represents a chimeric phosphorothioate oligonuclectide with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                           Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                          Chimeric phosphorothioate oligonucleotide to target Navl.3 #318.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
New antisense compound targeted to a nucleic acid molecule encoding aval.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                  Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                               Chimeric phosphorothioate oligonucleotide to target Navl.3 #317.
                                                                                                                                                                                                                                                                                                                    Claim 4; SEQ ID NO 317; 417pp; English.

```

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeninal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2.MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target Sequence 20 BP; 5 A; 2 C; 3 G; 10 T; 0 U; 0 Other; Query Match

Fifteen analogues of gelonin were constructed. Ten non-cysteine residues in surface positions and available for conjugation to a second protein were targeted for substin. In the other analogues, one or both of the native Cys residues present in gelonin were substd. Overlap extension PCR was used to construct the various analogues. Primer geloC-20 was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo.
                                                                                                                                                                                                 Type I ribosome-inactivating protein; ricin; momordin; immunoconjugate; autoimmune disease; cell killing; toxin; Mutagenic polymerase chain reaction; ss.
                                                                                                                                                                     PCR primer GeloC-20 to replace Ile103 of gelonin with Cys.

Proteolytic peptide fragments of native gelonin were sequenced. PCR primers were designed based on these peptide fragments. The primers were used to amplify segments c DNA covering the 5'-terminal, middle and 3'-terminal regions of the gelonin coding sequence. A composite gelonin gene sequence was assembled from the overlapping gelonin DNA fragments (see AAAQ42221). Having cloned the gelonin gene, the development of gelonin analogues and gene fusions is facilitated. See AAAQ37291 for gelonin amino acid sequence. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                    Type I ribosome-inactivating protein, ricin, momordin, immunoconjugate, autoimmune disease; cell killing; toxin, Euphorbiaceae family; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analogues of type I ribosome inactivating protein - useful as cytotoxion agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo.

                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention covers analogues of Type I RIPs. Gelonin is a Type I RIP and the analogues of the invention have a cysteine available for intermolecular disulphide bonding at an amino acid position corresp. to a position not naturally available for bonding; the cys residue is located in the C-terminal region of the analogue between a position corresp. to amino acid 251 and the C-terminus of ricin A chain. The analogues are pref. joined via a disulphide linkage to a molecule which specifically binds to a target cell, e.g. an antibody fragment. See AAR37291 for gelonin amino acid sequence. Analogues of Type I RIP are defined as non-naturally occurring protein but differ in A sequence. Preferred analogues have a Cys available for disulfide bonding located at a posn. It its AA sequence troming activity of the natural corresp. to posn. 251 in ricin A-chain RTA to the carboxy craminus of the analogue. (AAR74176 is the sequence of ricin A-chain RTA, which is a Type II RIP). The primary AA sequence of ricin A-chain RTA, which is a Type II RIP). The primary AA sequence of the Type I RIPS gelonin, BRIP, mormordin II, luffin [see Islam et al. Agricultural is located. (AAR74176 is 1931), alphatrichosanthin ([see Chow et al., 26, 1343-45, 1991], alphatrichosanthin ([see Chow et al., 31.1-4 1991), Mirabilis antiviral protein [see Habuka et al., 5. Biol. Chem., 264, [12) 6629-37 1989], pokeweed antiviral protein isolated from seeds [see Kung et al., Agric. Biol. Chem., 54, 120, 1331-18 1990] and saporin [see Banatti et al., Eur. J. Biochem., 133, 465-70 1989] are individually aligned with the primary sequence of the ricin A-chain [see Halling et al., Nucleic Acids Res., 13, 8019-8033 1983] respectively in Figures 1-9. The AAs invariant among the ricin A-chain and the Type I RIPS are indicated in FT. Also indicated are the preferred sites of Cys substitution. It is also preferred that the gelonin cysteine residues at costitions 44 and 50 be replaced with alamine residues. The complete DNA sequence of the gelonin gene is set out in AA022342.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAQ75532 encodes AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. RIPs are key components of cyctoxoic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                - which

  A new recombinant DNA vector construct has been developed which encodes a fusion protein and is suitable for introduction into a bacterial host.

The vector comprises: (a) DNA encoding at least one cationic bactericidal/permeability increasing peptide (BPI), (b) DNA encoding a carrier protein, and (c) DNA encoding an amino acid (a) cleavage site located between (a) and (b). The present sequence represents the pING3797 vector construct coding for a BPI fusion protein. The peptides have many uses including the treatment of bacterial and fungal infections. BPI peptides also bind to endotoxins and heparin, neutralising their effects. The peptides have further been shown to inhibit angiogenesis (partly due to heparin-binding activity). The fusion proteins have been found to be expressed in large amounts without significant proteclysis, and in some cases are actually secreted from the host cells. This allows the indirect
                                                                                                                                                                                                                                                                                                                                                          Recombinant production of bactericidal/permeability increasing protein - by expression as a fusion protein in microbial host cells, then cleaving

A new recombinant DNA vector construct has been developed which encodes a fusion protein and is suitable for introduction into a bacterial host. The vector comprises: (a) DNA encoding at least one cationic bactericidal/permeability increasing peptide (BPI), (b) DNA encoding a carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site located between (a) and (b). The present sequence represents the pING3795 vector construct coding for a BPI fusion protein. The peptides have many uses including the treatment of bacterial and fungal infections. BPI peptides also bind to endotoxins and heparin, neutralising their effects. The peptides have further been shown to inhibit angiogenesis (partly due to heparin-binding activity). The fusion proteins have been found to be expressed in large amounts without significant proteolysis, and in some cases are actually secreted from the host cells. This allows the indirect production of anti-microbial BPI peptides in microbial hosts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant production of bactericidal/permeability increasing protein - by expression as a fusion protein in microbial host cells, then cleaving

The vector comprises: (a) DNA encoding at least one cationic bactericidal/permeability increasing peptide (BPI), (b) DNA encoding a carrier protein, and (c) DNA encoding an amino acid (a) DNA encoding a located between (a) and (b). The present sequence represents the pING3793 vector construct coding for a BPI thason protein. The peptides have many uses including the treatment of bacterial and fungal infections. BPI peptides also bind to endotoxins and heparin, neutralising their effects. The peptides have further been shown to inhibit angiogenesis (partly due to heparin-binding activity). The fusion proteins have been found to be expressed in large amounts without significant proteolysis, and in some cases are actually secreted from the host cells. This allows the indirect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modified protein; reduced antigenicity; modified toxin; gelonin; designer toxin; immunotoxin; proteinaceous compound; cancer; microbial pathogenesis; acquired immunodeficiency syndrome; AIDS; autoimmune disease; hyperproliferative disorder; leukaemia; arthritis; inflammatory disease; cardiovascular disease; diabetes; arthritis; cardioidiseses; cyrostatic; antiarthritic; antiinflammatory; cardiant; antidiabetic; virucid; protozoacide; fungicide; antibacterial; recombinant gelonin; rGel; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cases are actually secreted from the host cells. This allows the indirect production of anti-microbial BPI peptides in microbial hosts
Recombinant production of bactericidal/permeability increasing protein - by expression as a fusion protein in microbial host cells, then cleaving the BPI peptide from the carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 24.8; DB 2; Length 1072;

The present invention relates to a method of generating a modified protein with reduced antigenicity while maintaining its biological activity. The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example cand/or possess reduced antigenicity. Such designer toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, skin, liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic, bone, bone marrow, head and neck, cervical, oseophagus, eye, gall bladder, kidney, adrenal glands, heart, colon, or blood cancer. The compositions of the invention are also useful for treating microbial pathogensis, acquired immunodeficiency syndrome (AIDS), autoimmune diseases, hyperproliferative disorders including cancer, leukaemias, arthiraminotory diseases, cardiovascular diseases, pathogenic consent sequence encodes murities single-chain syndrome than prior art. The petides and polypeptides, which are more effective than prior art. The mitisform recommendes murities single-chain successions and diabetes shown in a more single consent sequence encodes murities single-chain are more effective than prior art. The mitisform recomminant engages.

  Key
  The present invention relates to a method of generating a modified protein with reduced antigenicity while maintaining its biological activity. The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example and/or possess reduced antigenicity. Such designer toxins have therefore and/or possess reduced antigenicity. Such designer toxins have therepeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunocxin and genome compounds with less antigenicity. The immunocxin and genome compounds with less antigenicity. The immunocxin and skin, liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic, bone, bone marrow, head and neck, cervical, oesophagus, eye, gall bladder, kidney, adrenal glands, heart, colon, or blood cancer. The compositions of the invention are also useful for treating microbial pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune diseases, hyperproliferative disorders including cancer, leukaemias, arthiris, inflammantory diseases, cardiovascular diseases, pathogenic diseases, and diabetes. The method provides less antigenic proteins, peptides and polypeptides, which are more effective than prior art. The present sequence encodes G. multiflorum recombinant gelonin (rdel)
                                                                                                                                                                                                    cancer, AIDS, autoimmune diseases, comprises identifying a protein region antigenic in the first subject using antiserum from either the first or a

```
The invention relates to an isolated nucleic acid comprising at least 10 contiguous nucleotides of any of the 233 polynucleotide sequences given in the specification, or its complement. The nucleic acids encode cancer associated proteins. Also included are an expression vector comprising the isolated nucleic acid or expression vector, a microarray for detecting a cancer-associated (CA) nucleic acid comprising at least to contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above compression reading frame of a CA sequence selected from any of the 35 polynucleotide sequences as mentioned in the specification, or its complement), an isolated antibody, (or its antigen binding fragment) that binds a polymeptide, a hybridoma that produces the above monoclonal antibody, a pharmaceutical composition comprising the above antibody and a pharmaceutical composition comprising the above antibody and a pharmaceutical axcipient, a kit for detecting cancer of for detecting the presence or absence of cancer cells in an individual, a method for inhibiting growth of cancer cells in an individual, an enthod for inhibiting growth of cancer cells in an individual, an electronic library comprising the above polymetide (or their fragments), methods of screening for anticancer activity or for a bioactive agent capable of modulating the accipited and with avareasion of a cap protein (GAP), methods for all cancer cells cancer activity or for a bioactive agent capable of modulating and accipited and accipited and and accipited and and accipited and accipited and accipited and accipited and accipited and accipited and accipited and accipited and accipited and accipited and accipited accipited and accipited accipited and accipited accipited and accipited accipited accipited accipited accipited accipited accipited accipited accipited accipited accipited accipited
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated cancer-associated polynucleotides and polypeptides useful for diagnosing, preventing or treating cancers, especially lymphoma and leukemia, or in screening for agents that modulate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 20.6; DB 13; Length 38142;

The composition and methods are useful for detecting, diagnosing, preventing and treating cancers, especially lymphoma and leukaemia. These may also be used in screening for agents that modulate cancer. The present sequence is a mouse CAP genomic sequence. Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cancer. The present sequence is a mouse CAP genomic sequence. Notes as sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

for

Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of

The invention relates to novel genes and encoded proteins from

Claim 6; SEQ ID NO 1901; 49pp; English.

New Staphylococcus aureus protein, useful as a vaccine for treating or preventing Staphylococcal infection, specifically an infection caused by S. aureus, e.g. sepsis.

                                                                                                                                                                                                                                                                                                                                   exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            exon
  The Sequence in the Paragraphy of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of the sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the computer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

```

```
This DNA encodes human immunoglobulin E (IgE) high affinity receptor beta subunit (FC epsilon RI beta) exon 7 variath E337G. This variant is associated with atopy and atopic asthma. The variation is in exon 7 and is a nucleotide change from adenine to guanine at nucleotide 7297
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= n

                                                                                                  ö
(nucleotide 6843 in the Fc epsilon RI beta gene sequence of Kuster, et al. 1992). Detection of the protein is useful for diagnosis of atopy. In particular the E273G polymorphism may also define a subgroup of asthma suffers with a particular clinical course, in which case recognition of the variant/polymorphism would be of value in defining asthma prognosis and management. NB. This sequence was created using the sequence given in Genbank M89796.

```
This represents the coding sequence of a human beta subunit of Fc epsilon RI [high-affinity immunogiboulin B receptor]. The invention provides a peptide fragment (AAW75917) from the human Fc epsilon RI beta subunit protein that contains the amino acid sequence of an ARAM [antigen protein that contains the amino acid sequence of an ARAM [antigen prospirition activation mocifi]. Aspects of the invention are methods and compositions to inhibit the function of human beta subunit, thereby treating or preventing allergic reactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human IgB receptor beta subunit protein - and corresponding peptide(s)

//worfal sarvae which had been isolated from gerbils rhabditiform larvae which had been isolated from gerbils ryperimentally infected dogs. colon was constructed and, using adaptors, was cloned unidirectionally into the vector from the Brooks site to the XhoI site. The library has an unamplified titer of 1 x 10E5 pfu/ml and an amplified, undiluted titer of 9 x 10E11 pfu/ml. The average insert size of the unamplified library is 675 bp (range, 100-1700)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Direct Submission
